923323104307 – VISHNU G

EVENTFORCE

EVENT MANAGEMENT SYSTEM — FINAL PROJECT DOCUMENTATION

PROJECT AREA	Centralized event administration
CORE RECORDS	Events, Clients, Vendors, Venues
SUPPORTING MODULES	Event–Vendor coordination, Approvals & Flows, Feedback, Reports
PRIMARY PURPOSE	Organize event information and related operational activities in one interface

1. Project Overview

EVENTFORCE is a centralized event-management application that brings event, client, vendor, venue, workflow, feedback and reporting activities into a connected interface. The project material shows a dashboard for monitoring and dedicated modules for maintaining operational records. The event record acts as the main reference point, while supporting modules provide the resources and actions associated with the event lifecycle.

2. Project Scope

- Event planning and record management.
- Client and vendor information management.
- Venue and event-resource coordination.
- Approval and feedback activities.
- Operational reporting and monitoring.

3. Main Modules

Module	Main function
Dashboard	High-level counts, indicators and visual summaries.
Events	Stores event name, type, date, client, venue, budget and status.
Clients	Maintains client identity and contact information.
Vendors	Maintains service-provider and service details.
Venues	Maintains venue, hall, capacity and availability information.
Workflow	Supports approval requests and activity tracking.
Feedback	Stores ratings and comments from clients.
Reports	Summarizes operational information for review.

4. Working Principle

The system follows a connected-record approach: maintain people and resources, create an event, coordinate the venue and vendors, process workflow activities when required, monitor the event, capture feedback, and finally review dashboard and report information.

STEP 1	Maintain client and vendor records before event planning begins.
STEP 2	Create the event with date, type, client, venue, budget and status.
STEP 3	Connect the required venue and vendors to the event.
STEP 4	Use workflow/approval functions where review is required.
STEP 5	Monitor the event and review feedback and reports.

5. Problem Statement and Need

When event information is handled manually or across separate sources, duplicate information, delayed updates and difficulty in tracking event-related resources can occur. Users may need to check different records to understand one event. EVENTFORCE addresses this operational problem by keeping the principal event-related records within one system.

6. Need for the System

- A single location for event and client information.
- Structured vendor and service-provider records.
- Better visibility of venue and hall availability.
- A dedicated place for approval requests and workflow status.
- Feedback storage for reviewing client responses.
- Reports that summarize information already maintained by the system.

7. Objectives

Objective	Description
Centralize records	Keep event records and supporting information in one application.
Manage clients	Maintain client contact and address details.
Manage vendors	Maintain vendor profiles and service information.
Coordinate resources	Associate vendors and venues with specific events.
Support workflow	Provide approval activities and visible status.
Capture feedback	Store ratings and comments from clients.
Monitor operations	Provide dashboard and report views.

8. Conceptual Architecture

Layer	Purpose
Dashboard	Shows high-level counts, indicators and visual summaries.
Core Management	Maintains Events, Clients, Vendors and Venues.

Relationships	Connects events with vendors and other supporting records.
Workflow	Handles approvals and activity tracking.
Feedback & Reports	Provides post-event and summarized operational views.

9. Process Steps

STEP 1	Open the dashboard to understand current operational activity.
STEP 2	Navigate to the required record module instead of maintaining disconnected files.
STEP 3	Use event information as the central reference for client, venue and vendor relationships.
STEP 4	Move approval requests through visible workflow states when required.
STEP 5	Use feedback and reports after the operational activity to review results.

10. Dashboard Module

The dashboard is the first monitoring layer of EVENTFORCE. It presents counts for total events, clients, vendors and venues, together with an average rating. It also provides visual summaries for upcoming events, event type versus budget and event lifecycle status.

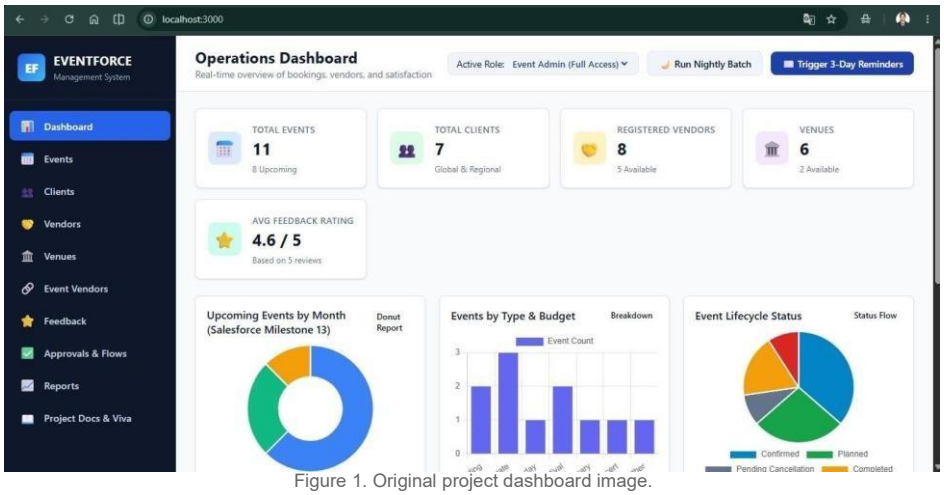

Figure 1. Original project dashboard image.

Figure 2. Focused dashboard visual view.

11. Dashboard Usage Steps

STEP 1	Start from the dashboard to obtain a summarized view.

STEP 2	Check event, client, vendor and venue counts.
STEP 3	Review upcoming-event and budget/status visuals.
STEP 4	Move to the relevant module for record-level action.
STEP 5	Return to the dashboard after updates.

12. Event Management Module

The Events module is the central record-management area. The supplied interface displays event ID, event name, event type, date, client, venue, budget and status.

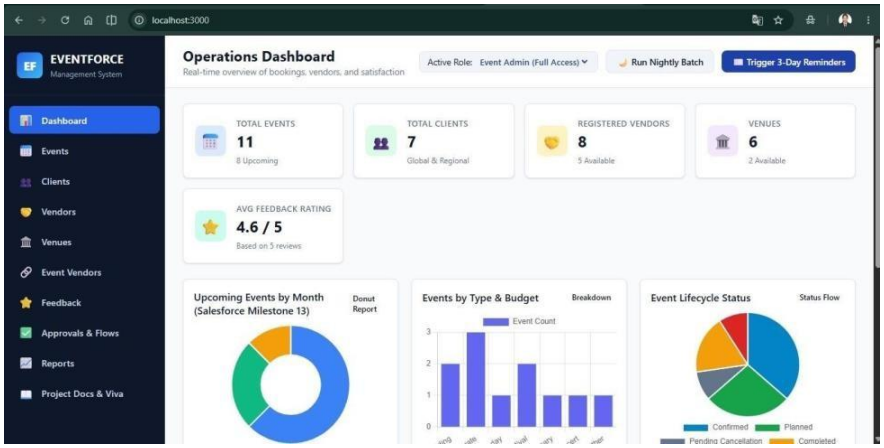

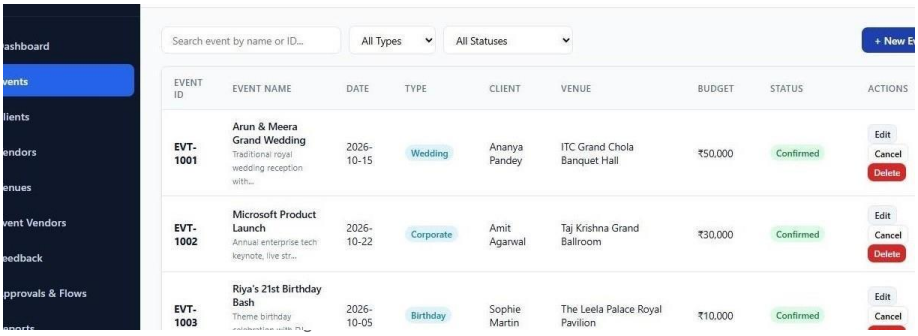

Figure 3. Original event-management image.

13. Event Record Components

Field	Role
Event ID	Identifies the event record.
Event Name	Provides the descriptive name.
Event Type	Classifies the event.
Date	Identifies the scheduled date.
Client	Connects the event to its client.
Venue	Identifies the selected location.

Budget	Represents the event budget.
Status	Indicates current event state.

14. Event Lifecycle

STEP 1	Create or select the event record.
STEP 2	Enter type, date, client, venue, budget and status.
STEP 3	Coordinate supporting vendors and resources.
STEP 4	Process approval/workflow activities when required.
STEP 5	Monitor the event and use feedback/reporting functions.

15. Client and Vendor Management

The Client Directory maintains information required to identify and contact clients. The supplied material includes client ID, name, email, phone, city, country and address. The Vendor module stores service-provider information such as vendor name, service type, email, phone, rating and status.

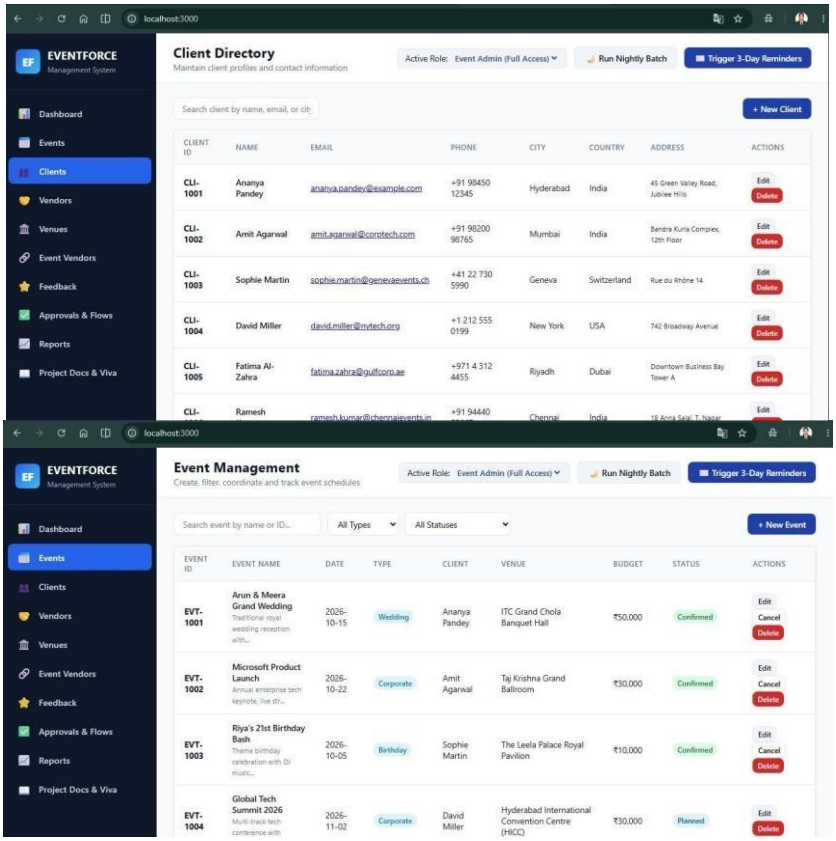

Figure 5. Original client/event-management visual from the supplied report.

Figure 6. Original project management visual.

16. Why Separate Client and Vendor Modules?

Clients and vendors play different roles in an event. A client is associated with the event as the customer or organizing party, while a vendor provides a service. Keeping records separate avoids mixing different information and makes event relationships clearer.

17. Management Steps

STEP 1	Create or maintain client records with contact information.
STEP 2	Create or maintain vendor records with service and status information.
STEP 3	Use search/filter facilities to locate existing records.
STEP 4	Connect the selected vendor to the relevant event.
STEP 5	Review the event record to confirm supporting relationships.

18. Venue, Hall and Resource Coordination

Venue information supports the physical planning of an event. The supplied project material shows venue names, addresses, capacity, hall details and availability. Event–Vendor coordination connects the event to service providers.

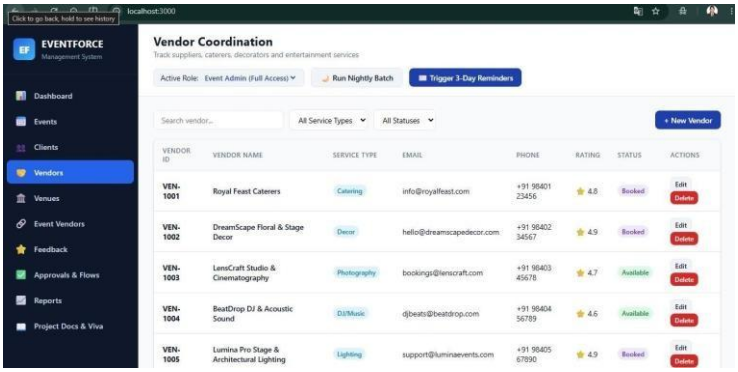

Figure 7. Original venue/resource image.

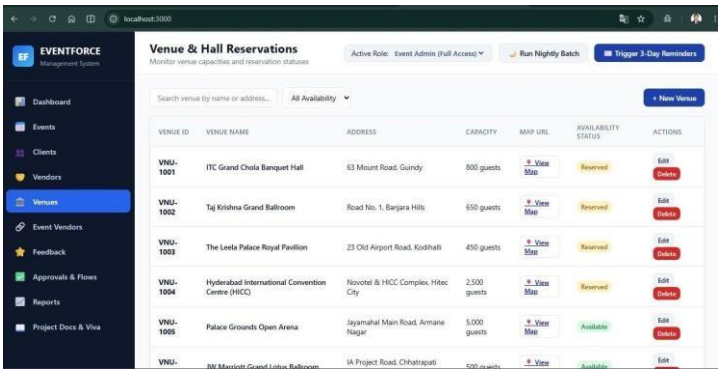

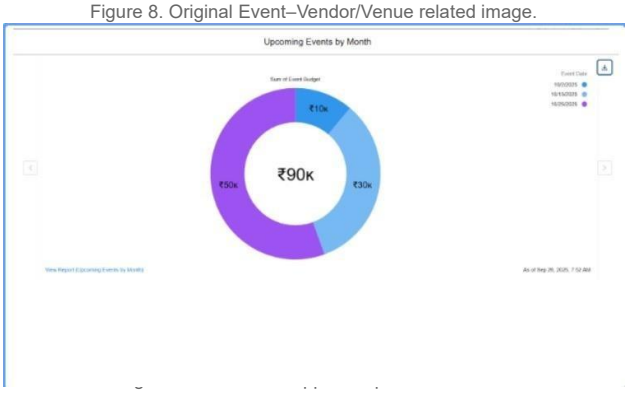

Figure 8. Original Event–Vendor/Venue related image.

19. Resource Coordination

Resource	Relationship
Event	Defines what is being planned.

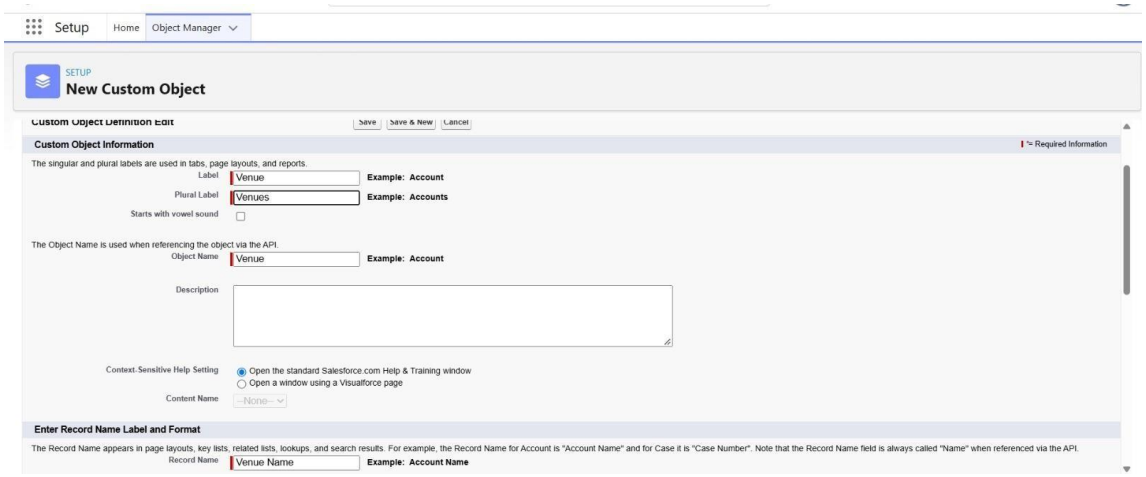

Client	Identifies the associated customer.
Venue	Provides the physical location.
Vendor	Provides required services.
Event–Vendor	Shows assignment.
Availability	Supports planning.

20. Coordination Steps

STEP 1	Review venue and hall information.
STEP 2	Check capacity, address and availability.
STEP 3	Select the venue associated with the event.
STEP 4	Identify required services and coordinate vendors.
STEP 5	Confirm venue and vendor relationships on the event record.

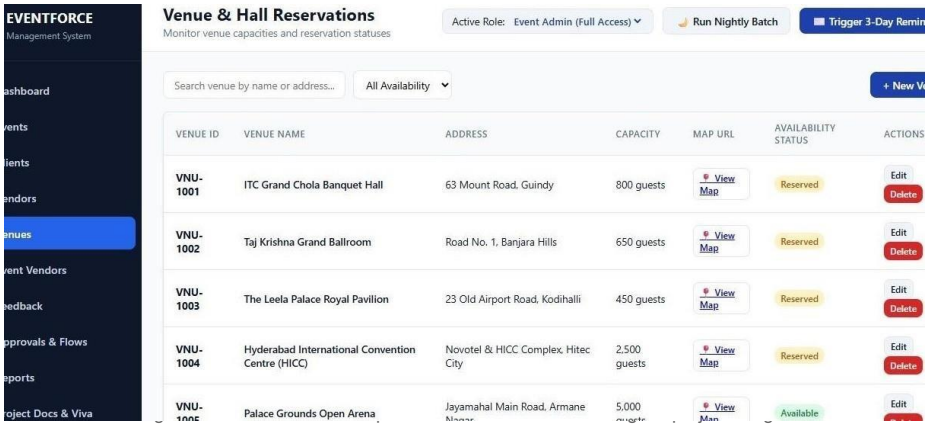

21. Custom Venue Object and Reporting

The supplied setup screenshot demonstrates creation of a custom Venue object with singular/plural labels, an object name, description and a Venue Name record field. This supports structured venue records within the application environment.

22. Reports and Analytics

The reporting area converts stored operational records into summarized information. The supplied material identifies reports for upcoming events, events by status, available venues, available vendors and client feedback.

23. Report Usage Steps

STEP 1	Open the required report from the reporting area.
STEP 2	Review the summarized operational information.
STEP 3	Use filters or the available report controls where provided.
STEP 4	Compare the report view with the maintained operational records.
STEP 5	Return to the dashboard or module for further record-level work.

24. Approvals, Feedback, Testing and Conclusion

The Approvals & Flows module provides a place for event-related requests that require review. The supplied material demonstrates visible status and approval/rejection controls. The feedback area records client ratings and comments associated with events.

25. Verification Checklist

Test area	Verification focus
Dashboard	Summary counts and visual sections display.
Events	Event fields and record-management actions.
Clients	Client details and search/filter behavior.
Vendors	Service, contact, rating and status information.
Event–Vendor	Event-to-vendor assignment information.
Approvals	Request status and workflow actions.
Feedback	Ratings and comments.

Reports	Summary information is displayed.

26. Overall System Workflow

Stage	System activity
1	Maintain client and vendor records.
2	Create the event with date, type, client, venue, budget and status.
3	Coordinate the required venue and vendors.
4	Process approval or workflow activities when required.
5	Monitor the event through the application.
6	Record client feedback after the event.
7	Review dashboard and report information.

27. Benefits

- Centralized access to event-related information.
- Structured client and vendor management.
- Clear event-resource relationships.
- Dedicated venue and availability information.
- Visible workflow activities.
- Client feedback can be reviewed.
- Dashboard and reports provide summaries.

28. Limitations

The supplied material mainly demonstrates the application interface and functional areas. It does not provide enough source evidence to document every backend technology, database schema, authentication implementation or deployment configuration. Therefore, this report describes only the functions visible in the supplied project material.

29. Future Scope

Proposed extensions include stronger role-based access control, automated notifications, richer report exports, advanced validation, expanded workflow rules and additional integrations. These are future improvements and are not presented as already implemented.

30. Final Conclusion

EVENTFORCE demonstrates a centralized approach to event management by combining event, client, vendor, venue, relationship, workflow, feedback and reporting functions. The supplied screens show how these modules can work together to organize the event lifecycle and provide structured operational information.

STEP 1	Maintain records in the appropriate module.
STEP 2	Create and update the central event record.

STEP 3	Coordinate venue and vendor resources.
STEP 4	Use workflow and approval functions when required.
STEP 5	Capture feedback and review dashboard/report information.
